VoiceAssured

Dropped Calls? Lost Connectivity?
Most call quality issues are caused by packet loss and latency issues originating from the last mile circuit provider. Imagine never having another dropped call due to the loss or degradation of your internet circuit.

MIX Networks' VoiceAssured technology continuously monitors the circuit links to the MIX Networks data centers. Sub-second failover ensures that calls remain active, and provides an uninterrupted connection of a live call to the next active circuit. VoiceAssured WAN smoothing further enhances this process by utilizing special packet technology to reconstruct any lost packets at the receiving device. This process assures the best possible quality of service over degraded internet connections.

Experience **MIX Networks' VoiceAssured** Advantage

- Cloud Managed and Continuously Monitored
- Advanced Outbound Logic Manipulation
- Seamless Voice Failover
- Advanced VPN Capability
- Multi-Data Center VPN Failover
- All Major 4G Carrier Support
- Multiple 4G Network Failover
- WAN Smoothing
- Hot Failover
- Downloadable & Bulk Configurations
- Advanced Firewall and Content Filtering
- Data Center and Multi-Site VPN Encryption
